The AI Learning Roadmap

A clear path from your first AI prompt to running full AI-powered workflows — broken into 3 stages, no fluff.

---

3 STAGES INSIDE

Beginner	Weeks 1-2
Intermediate	Weeks 3-6
Advanced	Month 2+

STAGE 1 Beginner

Weeks 1-2 · Goal: Get comfortable talking to AI and trust it with small tasks

Pick one chatbot and use it daily

Choose ChatGPT, Claude, or Gemini. Use it for real tasks — emails, quick research, brainstorming — not just testing.

Learn to write a clear prompt

Practice specifying format, tone, and length in every request. This alone fixes most "bad AI output" complaints.

Try one AI image tool

Generate 5-10 images in Canva AI or Leonardo AI to understand how prompt wording affects visual output.

Fact-check everything the AI tells you once

Pick one AI-generated claim and verify it independently. This builds the healthy habit of not blindly trusting output.

Save 3 prompts that worked well

Keep a running note of prompts that gave you great results — you'll reuse and adapt these constantly.

STAGE 2 Intermediate

Weeks 3-6 · Goal: Use AI for real output, not just conversation

Use AI for one recurring task at work or in your business

Pick something you do weekly (social captions, meeting notes, first-draft emails) and hand it to AI consistently.

Learn iterative prompting

Instead of restarting, practice refining: "make it shorter," "more casual," "add a stat." This is the real skill gap between beginners and everyone else.

Try a specialized tool in your field

Writers try Jasper; coders try GitHub Copilot or Cursor; marketers try an AI ad-copy tool. Go deeper in one category.

Combine two AI tools in one workflow

Example: write a script with a chatbot, then turn it into a video with an AI video tool. Chaining tools together is where real time savings start.

Set up one basic automation

Use an AI agent tool (like Claw AI Army) or a simple workflow to handle a task end-to-end without you manually running each step.

STAGE 3 Advanced

Month 2+ · Goal: Run AI-powered systems, not just individual tasks

Build a multi-step AI workflow

Chain 3+ tools or steps together — e.g. lead capture → AI-drafted follow-up → automated scheduling — with minimal manual work.

Add human checkpoints where it matters

Identify which parts of your workflow need review before publishing (client-facing content, financial decisions) vs. which can run fully automated.

Track ROI on your AI tools

Measure time saved and output quality against what each tool costs. Drop tools that aren't earning their subscription.

Teach someone else your workflow

If you can explain your AI-assisted process clearly enough for someone else to run it, you've truly internalized it — and can now delegate it.

Stay current every month

AI tools change fast. Set a recurring 30-minute monthly check-in to review new tools and features relevant to your workflow.
